Long Live E-Business Server for Enterprise-Scale Encryption

Long-trusted vendor assumes full support, maintenance, and development for versatile and easy-to-use data security tool.

Minneapolis, MN (SDS) August 11, 2013 – Software Diversified Services today assumed all sales, support, maintenance, and development responsibilities for the E-Business Server suite of data encryption and security tools. SDS's commitment means this enterprise-scale encryption server will remain a trusted data-security tool for years to come.

"SDS recognizes the inherent value of the E-Business Server for protecting data at rest and in transit, especially at the large scales required by our traditional customers: Fortune 1,000 corporations and large government agencies," said Jim Lampi, vice president of SDS. "We are committed to bringing the E-Business security tools back up to speed. SDS will ensure they work reliably with state-of-the art encryption algorithms, and on new computer platforms, including Windows 8 and zEnterprise® EC12."

Lampi also emphasized the goal of maintaining E-Business Server's credibility with auditors and the organizations that enforce compliance with security standards—for example, the PCI Security Standards Council (PCI is the "payment card industry").

Support and further development of E-Business Server by SDS has the advantage of teaming with the company's other security tools. Its VitalSigns for FTP software automates enforcement of security standards throughout enterprises. Its collaboration SSH Corporation provides SSH encryption for data in transit through networks.

E-Business Server provides a simple-to-use infrastructure for PGP encryption throughout an enterprise. Features include automatic encryption of e-mail; unified, browser-based controls for managing multiple key and certification servers; data compression and automatic translation between ASCII and EBCDIC character sets; versatile APIs for integrating security into applications, scripts, and batch processes.

About Software Diversified Services

Founded in 1982, Software Diversified Services (SDS) is a Minnesota-based company that provides business software solutions to hundreds of customers worldwide, including many Global 500 companies. Current customers represent industries including banking, finance, insurance, retail and government. SDS is noted for its industry-leading software, documentation and technical support.
