

# Key Features & Benefits

## Send z/OS Events to Any SIEM

VSA can deliver z/OS event information to any enterprise SIEM. VSA is certified in LEF and CEEF formats.

## Advanced, Granular Filtering

Drill down to the subtype level and choose exactly the type of data to send to your SIEM! APIs and ISPF Edit provide easy filtering options.

## Lower SIEM Operating Costs

By filtering out the extra noise before sending to your SIEM, you'll save resources and lower SIEM license charges. Plus, less false alarms!

## Early Threat Detection

VSA uses both signature- and anomaly-based attack detection. It will send alerts in real time, before any serious damage has been done.

## Gain Real-Time Visibility

By incorporating mainframe security event information, your enterprise SIEM will finally be exactly that: an enterprise-wide SIEM solution!

## Easy Install: no IPLs on z/OS

VSA doesn't require IPLs for install on your z/OS system. After install, VSA requires very little effort to send real-time z/OS data to SIEM.
